How to add Memory to an LLMChain

This notebook goes over how to use the Memory class with an LLMChain. For the purposes of this walkthrough, we will add the ConversationBufferMemory class, although this can be any memory class.

```python
from langchain.chains import LLMChain
from langchain.llms import OpenAI
from langchain.memory import ConversationBufferMemory
from langchain.prompts import PromptTemplate
```

API Reference:

- LLMChain from `langchain.chains`

- OpenAI from `langchain.llms`

- ConversationBufferMemory from `langchain.memory`

- PromptTemplate from `langchain.prompts`

The most important step is setting up the prompt correctly. In the below prompt, we have two input keys: one for the actual input, another for the input from the Memory class. Importantly, we make sure the keys in the PromptTemplate and the ConversationBufferMemory match up (`chat_history`).

```python
template = """You are a chatbot having a conversation with a human.

{chat_history}
Human: {human_input}
Chatbot:"""

prompt = PromptTemplate(
    input_variables=["chat_history", "human_input"], template=template
)
memory = ConversationBufferMemory(memory_key="chat_history")
```

```python
llm = OpenAI()
llm_chain = LLMChain(
    llm=llm,
    prompt=prompt,
    verbose=True,
    memory=memory,
)
```

```python
llm_chain.predict(human_input="Hi there my friend")
```

```
    > Entering new LLMChain chain...
    Prompt after formatting:
    You are a chatbot having a conversation with a human.

    Human: Hi there my friend
    Chatbot:

    > Finished chain.

    ' Hi there! How can I help you today?'
```

```python
llm_chain.predict(human_input="Not too bad - how are you?")
```

```
    > Entering new LLMChain chain...
    Prompt after formatting:
    You are a chatbot having a conversation with a human.

    Human: Hi there my friend
    AI:  Hi there! How can I help you today?
```

```
    Human: Not too bad — how are you?
    Chatbot:

    > Finished chain.

    " I'm doing great, thanks for asking! How are you doing?"
```

Adding Memory to a Chat Model-based LLMChain

The above works for completion-style LLMs, but if you are using a chat model, you will likely get better performance using structured chat messages. Below is an example.

```python
from langchain.chat_models import ChatOpenAI
from langchain.schema import SystemMessage
from langchain.prompts import ChatPromptTemplate,
HumanMessagePromptTemplate, MessagesPlaceholder
```

API Reference:

- ChatOpenAI from `langchain.chat_models`

- SystemMessage from `langchain.schema`

- ChatPromptTemplate from `langchain.prompts`

- HumanMessagePromptTemplate from `langchain.prompts`

- MessagesPlaceholder from `langchain.prompts`

We will use the ChatPromptTemplate class to set up the chat prompt.

The from_messages method creates a ChatPromptTemplate from a list of messages (e.g., SystemMessage, HumanMessage, AIMessage, ChatMessage, etc.) or message templates, such as the MessagesPlaceholder below.

The configuration below makes it so the memory will be injected to the middle of the chat prompt, in the "chat_history" key, and the user's inputs will be added in a human/user message to the end

of the chat prompt.

```python
prompt = ChatPromptTemplate.from_messages([
    SystemMessage(content="You are a chatbot having a conversation with a
human."), # The persistent system prompt
    MessagesPlaceholder(variable_name="chat_history"), # Where the memory
will be stored.
    HumanMessagePromptTemplate.from_template("{human_input}"), # Where the
human input will injectd
])

memory = ConversationBufferMemory(memory_key="chat_history",
return_messages=True)
```

```python
llm = ChatOpenAI()

chat_llm_chain = LLMChain(
    llm=llm,
    prompt=prompt,
    verbose=True,
    memory=memory,
)
```

```python
chat_llm_chain.predict(human_input="Hi there my friend")
```

```
    > Entering new LLMChain chain...
    Prompt after formatting:
    System: You are a chatbot having a conversation with a human.
    Human: Hi there my friend

    > Finished chain.
```

```
    'Hello! How can I assist you today, my friend?'
```

```
chat_llm_chain.predict(human_input="Not too bad — how are you?")
```

```
    > Entering new LLMChain chain...
    Prompt after formatting:
    System: You are a chatbot having a conversation with a human.
    Human: Hi there my friend
    AI: Hello! How can I assist you today, my friend?
    Human: Not too bad — how are you?

    > Finished chain.

    "I'm an AI chatbot, so I don't have feelings, but I'm here to help and
chat with you! Is there something specific you would like to talk about or
any questions I can assist you with?"
```
